

Inpatient Services

Drucker Brain Injury Center provides comprehensive rehabilitation services for those who need hospital care.

People with traumatic brain injuries face tremendous challenges. MossRehab's spectrum of inpatient programs address people's varied rehabilitation needs, including evaluation of those in a vegetative state and treatment for disorders that limit mobility. Through its various programs, Drucker Brain Injury Center treats approximately 200 inpatients each year, with about 90 percent returning to their homes.

An important element of all our programs is family involvement. Every Drucker Brain Injury program includes education and training for family members, who play a vital role in helping a loved one with brain injury make progress. We also provide support for family members, helping them deal with the stress often associated with caring for someone with a disability.

- The Comprehensive Rehabilitation Program is for people who have experienced severe brain injury and who need hospitalization. Our treatment team begins by assessing the individual's ability to function. The team then develops a program to help patients regain self-care skills and mobility and improve mental skills, communications and social behavior. Guided by our team of rehab experts, our patients work to develop the skills that will enable them to return to community life.

- The Responsiveness Program evaluates people who are either in a coma, emerging from a coma or have a questionable ability to participate in rehabilitation therapy.

- The Neuro-orthopaedic Program provides help for people whose arms and legs have limited or no mobility due to brain injury or other neurological disorders.
